

Hand off your AI project in one click.

Built something with [ChatGPT](#), [Claude](#), or [Gemini](#)? Pass it to a teammate with one simple code — no coding, no Git.

◆ Free for Mac

Sharing AI-built work is harder than it should be.

Normally, handing off code means Git, GitHub, and the terminal — a wall for anyone who isn't a developer. **Baton replaces all of it with a single shareable code.**

The whole project — and a note on where you left off — lands on their computer, ready to keep building.

Three steps. That's it.

- 1** **Pick your folder.** Baton packages it and gives you a code — already copied to your clipboard.
- 2** **Text or email the code** to your teammate.
- 3** **They paste it into Baton** — the project lands on their Desktop, ready to open and continue.

Why people love it

No Git or GitHub

Nothing to set up or learn.

Works with any AI

ChatGPT, Claude, or Gemini.

Keeps your context

A note on where you left off.

Secrets stay safe

Never shares your .env or keys.

Beginner-friendly

If you can send a text, you can use it.

Free

And it supports a good mission.
